Olufisayo Bamidele

Senior Software Engineer | Product, Backend and Platform

Berlin, Germany | olufisayo.bam@gmail.com
linkedin.com/in/olufisayo-bamidele-fizzy/ | github.com/ngfizzy

PROFILE

Software engineer with over nine years of experience building production products and services across fintech, customer communications, sales automation and platform security. I work across backend and frontend code, cloud infrastructure and engineering teams to ship useful features, improve reliability and guide technical changes from design through production.

TECHNICAL STRENGTHS

Languages and frameworks: Python, TypeScript, JavaScript, Go, Node.js, NestJS, Django, FastAPI, React

Data and integration: PostgreSQL, MySQL, Redis, RabbitMQ, Celery, REST APIs, event-driven services

Cloud and delivery: AWS, Google Cloud, Docker, Kubernetes, Terraform, Helm, GitHub Actions

Engineering: system design, production operations, security, migrations, code review and mentoring

EXPERIENCE

Senior Full-Stack Engineer | Smava, Berlin

May 2025 - Present

- Contributed to shared customer-communication services for calls, SMS and email, including provider integrations, fallback handling, retries and recovery of failed messages.
- Built a multi-agent phone assistant with other engineers for loan enquiries, connecting customer identification, knowledge-backed answers, tool calls and handoffs to human advisors.
- Built a OneSignal-backed push-notification channel for a new mobile app, including subscription checks, delivery-status events, deep links and rollout controls.
- Reduced AI call-summary inference costs by an estimated 47% through AWS Bedrock prompt caching.
- Built an AI-assisted documentation workflow across more than 600 repositories, making system context easier to access and helping shorten delivery cycles.
- Extended communication services beyond loan products with versioned events, product-specific consent and business-scoped messaging identity resolution.
- Standardized unit-test coverage reporting across ten services and contributed practical test setup guidance for other engineers.
- Retired a legacy transcription path and its obsolete code, permissions, configuration, metrics and tests; also contributed service-mesh routing changes across seven services.

Senior Software Engineer | Comx.io, Berlin

Feb 2023 - Apr 2025

- Built an AI automation feature end to end that enabled a workflow previously handled by 200 offshore workers to be managed by one operator.
- Architected and built an in-house Python translation service with Celery, RabbitMQ and Kubernetes autoscaling, reducing Google Translate API costs by 92%.
- Built AI-assisted reply classification with operator review of model disagreements and contributed PostgreSQL indexing and background-task progress and failure handling.
- Automated campaign scheduling and lead blocklisting, consolidating a multi-tool workflow into product controls.
- Contributed to a client-facing application rewrite, campaign performance dashboards and role-based access controls.
- Implemented AI-assisted follow-up scheduling from message text, with date validation, and persisted background-task status and failure details.

Platform Engineer / Lead Security Engineer | Chipper Cash, Remote

Jun 2021 - Feb 2023

- Planned and drove a completed production migration from stateless token authentication to session-backed state across Auth and Core services, including account-token invalidation and device revocation paths.
- Extended a shared TypeScript logging library with structured metadata, severity levels and sensitive-field masking, then migrated call sites across core and messaging services.
- Coordinated backend and compliance engineers on logging conventions and a multi-service migration, including request and background-job paths.

- Led cross-team API security audits and addressed account-takeover risks. Blocked SMS toll fraud with risk-based rate limits, saving up to $30,000 per month.
- Contributed to multi-factor and risk-based authentication controls to address account-takeover vulnerabilities.
- Built support dashboards and recovery tools that helped customer-service staff investigate and respond to compromised accounts.
- Collaborated on DDoS mitigation and intrusion-detection work across platform and security teams.
- Developed typed RabbitMQ messaging contracts and co-authored an RFC for the next queue-library interface.
- Served as a code owner for authentication and messaging services, reviewing changes and supporting colleagues through technical explanations and knowledge sharing.

Contract Software Engineer | Opinary, Remote 2022

- Contributed to a Go event-processing service that counted impressions and votes in Redis and exposed engagement metrics through HTTP APIs, with handler and consumer tests.
- Adapted Go recommendation and targeting services to updated data contracts and publisher synchronization paths, with compatibility tests.
- Built a synchronization path for topic-based ad targeting through Xandr's key-value API.
- Contributed to a squad migration of recommendation services from Kubernetes to Google Cloud Run.
- Added Django video-poll models, API queries and import tooling, and strengthened scope-aware permission handling with tests.

Technical Team Lead | Gotahia, Nigeria Dec 2020 - Dec 2021

- Revived a stalled product and led it to launch within two months by turning ideas into requirements, implementation tickets and coordinated team delivery.
- Led an incremental frontend rewrite with reusable React components and established automated build and deployment workflows.
- Worked with the founder and designers on product requirements, wireframes and user journeys, turning decisions into deliverable tickets.
- Ran team planning and delivery ceremonies, pair-programmed with developers and organized skill-sharing sessions.

Software Engineer | Andela, Nigeria Jun 2017 - Dec 2021

- Built contact-management capabilities and contributed to EasyCLA for Linux Foundation open-source enablement products.
- Built Linux Foundation GraphQL adapters for organization and security data and contributed portal views for vulnerability and remediation summaries.
- Migrated a legacy PHP quotation and invoicing application for a business software client.
- Implemented integrations with business-management and CRM systems for that quotation product.
- Contributed authentication and core user interfaces for Safaricom DigiFarm, an agricultural finance platform.
- Built credit-checking flows and offline payment reconciliation for CleanChoice Energy's customer platform.

INDEPENDENT ENGINEERING

Build reusable engineering workflows and public technical examples, including agent skills, application code and writing at github.com/ngfizzy.

EDUCATION

Computer science coursework, Federal University of Technology Akure, Nigeria (2014–2017); Andela Talent Accelerator, software engineering program (2017).

CERTIFICATIONS AND TRAINING

Ultimate Syntax and Ultimate Go Programming, Ardan Labs (2022); Working With Concurrency in Golang, Udemy (2023); Triplebyte Certified Generalist Software Engineer (2020).
